

ABSTRACT

The Vehicle Assistance Network is a web-based application developed to streamline vehicle service center operations by eliminating manual processes. It allows customers to request services online, track status updates, and receive timely notifications, reducing the need for physical visits. Admins can manage users, assign services, and generate reports, while employees handle job cards and service updates digitally.

Developed using React JS, Material-UI, Node.js, and MySQL, the system supports responsive UI, real-time data handling, and secure access for admins, employees, and customers. Key modules include service request management, job card handling, billing, and feedback collection.

This project was completed during an internship at Accolade Tech Solutions, offering hands-on experience in frontend development, API integration, and database connectivity. The application enhances service efficiency, improves communication, and provides a centralized platform for better user experience and operational control.
